

Abstract of the Disclosure

A method of managing well file records includes storing a well file on a first computer at a home base location and communicating the well file to a second computer at a remote well site. The well file serves as a blueprint that describes the well and its various components, and can be a valuable a reference tool for crews doing repair or service work on the well. When the work involves replacing or changing any of the well components, the crew can immediately update the well file using the computer at the well site. In some cases, part numbers and other information are scanned into the computer to minimize human error. Information between the two computers is accomplished by way of a wireless communication link and the Internet.
